The “Developmental Neurobiology” group, member of the Center for Organismal Studies (COS) and the Interdisciplinary Center for Neurosciences (IZN), is looking for a highly motivated

Postdoc

We are interested in the molecular basis of axon growth during development and regeneration. The Postdoc project will focus on the interactions of cell adhesion molecules with other types of proteins and the impact of these interactions on axon elongation and navigation. Substantial amounts of data have already been collected for several projects and the Postdoc is expected to complete and publish these studies. In addition to these basic research projects, a new translational project could be started aiming at the improvement of axon regeneration.

We are a small but well-equipped group with access to all facilities on the campus. The position is available from 1st of March (also a later start is possible); payment will be according to German TV-L13. Please send your CV, relevant certificates, and a short letter of motivation (all documents as one pdf file) to G.E.Pollerberg@cos.uni-heidelberg.de. Preference will be given to equally qualified applicants with severe disabilities. For further inquiries, please do not hesitate to contact Elisabeth Pollerberg.
